Class 9: Halloween Mini Project

Linh Dang (PID: A16897764)

Table of contents

Today we will take a wee step back to some data we can taste and explore the correlation
structure and principal components of some Halloween candy.

Data import

```
candy_file <- "candy-data.csv"

candy = read.csv(candy_file, row.names=1)
head(candy)
```

```
              chocolate fruity caramel peanutyalmondy nougat crispedricewafer
100 Grand             1      0       1              0      0                1
3 Musketeers          1      0       0              0      1                0

One quarter     0   0        0        0.011      0.511   46.11650
Air Heads       0   0        0        0.906      0.511   52.34146
Almond Joy      0   1        0        0.465      0.767   50.34755
```

Q1. How many different candy types are in this dataset?

```
nrow(candy)
```

```
[1] 85
```

Q2. How many fruity candy types are in the dataset?

```
sum(candy$fruity)
```

```
[1] 38
```

What is your favorite candy?

```
candy["Twix",]$winpercent
```

```
[1] 81.64291
```

Q3. What is your favorite candy in the dataset and what is it's winpercent value?

My favorite candy is Twix with a winpercent of 81.6%.

Q4. What is the winpercent value for "Kit Kat"?

```
candy["Kit Kat",]$winpercent
```

```
[1] 76.7686
```

Q5. What is the winpercent value for "Tootsie Roll Snack Bars"?

```
candy["Tootsie Roll Snack Bars",]$winpercent
```

```
[1] 49.6535
```

Exploratory Analysis

We can use the **skimr** package to get a quick overview of a given dataset. This can be useful for the first time you encounter a new dataset.

```
skimr::skim(candy)
```

Table 1: Data summary

Name	candy
Number of rows	85
Number of columns	12
Column type frequency:	
numeric	12
Group variables	None

Variable type: numeric

skim_variable	n_missing	complete_rate	mean	sd	p0	p25	p50	p75	p100	hist
chocolate	0	1	0.44	0.50	0.00	0.00	0.00	1.00	1.00	
fruity	0	1	0.45	0.50	0.00	0.00	0.00	1.00	1.00	
caramel	0	1	0.16	0.37	0.00	0.00	0.00	0.00	1.00	
peanutyalmondy	0	1	0.16	0.37	0.00	0.00	0.00	0.00	1.00	
nougat	0	1	0.08	0.28	0.00	0.00	0.00	0.00	1.00	
crispedricewafer	0	1	0.08	0.28	0.00	0.00	0.00	0.00	1.00	
hard	0	1	0.18	0.38	0.00	0.00	0.00	0.00	1.00	
bar	0	1	0.25	0.43	0.00	0.00	0.00	0.00	1.00	
pluribus	0	1	0.52	0.50	0.00	0.00	1.00	1.00	1.00	
sugarpercent	0	1	0.48	0.28	0.01	0.22	0.47	0.73	0.99	
pricepercent	0	1	0.47	0.29	0.01	0.26	0.47	0.65	0.98	
winpercent	0	1	50.32	14.71	22.45	39.14	47.83	59.86	84.18	

Q6. Is there any variable/column that looks to be on a different scale to the majority of the other columns in the dataset?
It looks like the last column `candy$winpercent` is on a different scale to all others.

Q7. What do you think a zero and one represent for the candy$chocolate column?

A zero means that candy has chocolate while one means that the candy has no chocolate in it.

Q8. Plot a histogram of winpercent values

```r
hist(candy$winpercent, breaks = 30)
```

Histogram of candy$winpercent

```r
library(ggplot2)

ggplot(candy) +
  aes(winpercent) +
  geom_histogram(bins = 10, fill="lightblue")
```

Q9. Is the distribution of winpercent values symmetrical?

The distribution of winpercent values is not symmetrical.

Q10. Is the center of the distribution above or below 50%?

```
summary(candy$winpercent)
```

```
  Min. 1st Qu.  Median    Mean 3rd Qu.    Max.
 22.45   39.14   47.83   50.32   59.86   84.18
```

The center of the distribution is below 50% because median is 47.83.

Q11. On average is chocolate candy higher or lower ranked than fruit candy?

```
choc.inds <- candy$chocolate == 1
choc.candy <- candy[ choc.inds, ]
choc.win <- choc.candy$winpercent
mean(choc.win)
```

```
[1] 60.92153
```

```
fruit.win <- candy[ as.logical(candy$fruity), ]$winpercent
mean(fruit.win)
```

```
[1] 44.11974
```

On average, chocolate candy is higher than fruit candy.

> Q12. Is this difference statistically significant?

```
ans <- t.test(choc.win, fruit.win)
ans
```

```
    Welch Two Sample t-test

data:  choc.win and fruit.win
t = 6.2582, df = 68.882, p-value = 2.871e-08
alternative hypothesis: true difference in means is not equal to 0
95 percent confidence interval:
 11.44563 22.15795
sample estimates:
mean of x mean of y
 60.92153  44.11974
```

Yes, with a P-value of 2.8713778×10^{-8}.

3. Overall Candy Rankings

There are two related functions that can help here, on is the classic `sort()` and `order()`

```
x <- c(5, 10, 1, 4)
sort(x)
```

```
[1]  1  4  5 10
```

```
order(x)
```

```
[1] 3 4 1 2
```

> Q13. What are the five least liked candy types in this set?

```r
inds <- order( candy$winpercent )
head( candy[inds,], 5 )
```

	chocolate	fruity	caramel	peanutyalmondy	nougat
Nik L Nip	0	1	0	0	0
Boston Baked Beans	0	0	0	1	0
Chiclets	0	1	0	0	0
Super Bubble	0	1	0	0	0
Jawbusters	0	1	0	0	0

	crispedricewafer	hard	bar	pluribus	sugarpercent	pricepercent
Nik L Nip	0	0	0	1	0.197	0.976
Boston Baked Beans	0	0	0	1	0.313	0.511
Chiclets	0	0	0	1	0.046	0.325
Super Bubble	0	0	0	0	0.162	0.116
Jawbusters	0	1	0	1	0.093	0.511

	winpercent
Nik L Nip	22.44534
Boston Baked Beans	23.41782
Chiclets	24.52499
Super Bubble	27.30386
Jawbusters	28.12744

Q14. What are the top 5 all time favorite candy types out of this set?

```r
inds <- order( candy$winpercent, decreasing = T )
head( candy[inds,], 5 )
```

	chocolate	fruity	caramel	peanutyalmondy	nougat
Reese's Peanut Butter cup	1	0	0	1	0
Reese's Miniatures	1	0	0	1	0
Twix	1	0	1	0	0
Kit Kat	1	0	0	0	0
Snickers	1	0	1	1	1

	crispedricewafer	hard	bar	pluribus	sugarpercent
Reese's Peanut Butter cup	0	0	0	0	0.720
Reese's Miniatures	0	0	0	0	0.034
Twix	1	0	1	0	0.546
Kit Kat	1	0	1	0	0.313
Snickers	0	0	1	0	0.546

|	pricepercent	winpercent
Reese's Peanut Butter cup	0.651	84.18029

```
Reese's Miniatures                    0.279   81.86626
Twix                                  0.906   81.64291
Kit Kat                               0.511   76.76860
Snickers                              0.651   76.67378
```
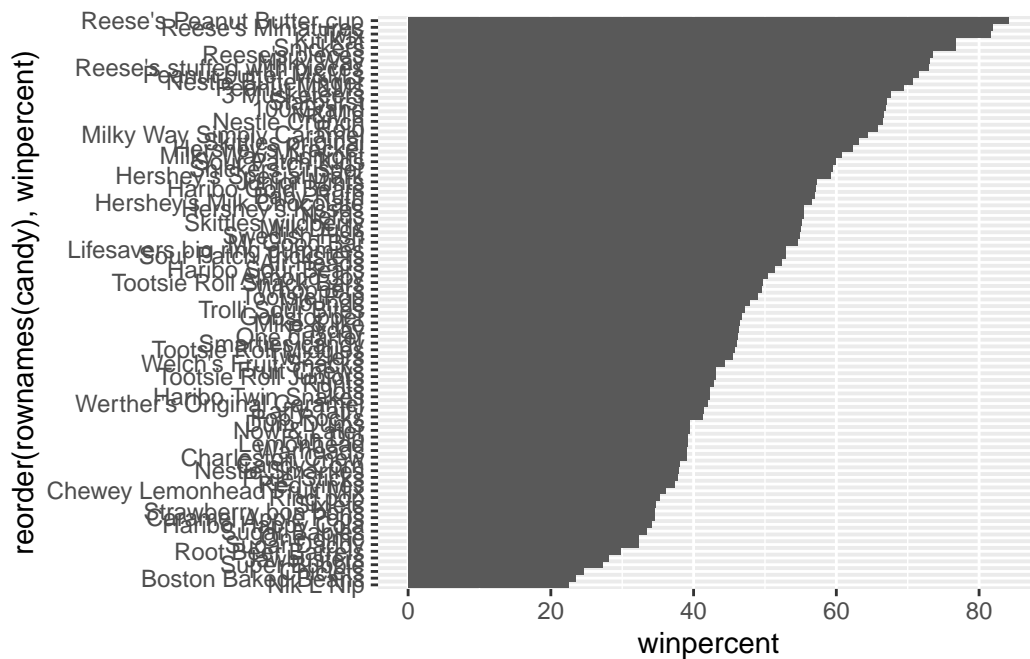

Make a bar plot with ggplot and order it by winpercent values.

```
ggplot(candy) +
  aes(winpercent, rownames(candy)) +
  geom_col()
```

```
ggplot(candy) +
  aes(winpercent, reorder( rownames(candy), winpercent )) +
  geom_col()
```
```
ggplot(candy) +
  aes(winpercent, reorder( rownames(candy), winpercent )) +
  geom_col(fill="red")
```

```
ggplot(candy) +
  aes(x=winpercent, y=reorder( rownames(candy), winpercent),
      fill=chocolate) +
  geom_col()
```

Here we want a custom color vector to color each bar the way we want - with `chocolate` and
`fruity` candy together with wheter it is a bar or not

```
mycols <- rep("gray", nrow(candy))
mycols[as.logical(candy$chocolate)] <- "chocolate"
mycols[as.logical(candy$fruity)] <- "pink"
mycols[as.logical(candy$bar)] <- "brown"

#mycols
ggplot(candy) +
  aes(winpercent, reorder( rownames(candy), winpercent )) +
  geom_col(fill=mycols)
```
```
ggsave("mybarplot.png", width=3, height=6)
```

Figure 1: My silly barplot image

## 4. Winpercent vs Pricepercent

```
# Pink and gray is too light, let's change to red
library(ggrepel)
mycols <- rep("black", nrow(candy))
mycols[as.logical(candy$chocolate)] <- "chocolate"
mycols[as.logical(candy$fruity)] <- "red"
mycols[as.logical(candy$bar)] <- "brown"

# How about a plot of price vs win
ggplot(candy) +
  aes(winpercent, pricepercent, label=rownames(candy)) +
  geom_point(col=mycols) +
  geom_text_repel(col=mycols, size=3.3, max.overlaps = 5)
```

```
Warning: ggrepel: 65 unlabeled data points (too many overlaps). Consider
increasing max.overlaps
```
5. Correlation Structure

```
cij <- cor(candy)
cij
```

```
                  chocolate      fruity      caramel peanutyalmondy      nougat

```

```
library(corrplot)
```

```
corrplot 0.95 loaded
```

```
corrplot(cij)
```

Q22. Examining this plot what two variables are anti-correlated (i.e. have minus values)?

Chocolate and fruity are negatively correlated.

```
cij["chocolate", "fruity"]
```

```
[1] -0.7417211
```

Q23. Similarly, what two variables are most positively correlated?

Winpercent and chocolate are most positively correlated.

```
cij["winpercent", "chocolate"]
```

```
[1] 0.6365167
```

Principal Component Analysis (PCA)

We need to be sure to scale our input `candy` data before PCA as we have the `winpercent` column on a different scale to all others in the dataset.

```
pca <- prcomp(candy, scale=T)
summary(pca)
```

```
Importance of components:
                          PC1    PC2    PC3     PC4    PC5     PC6     PC7
Standard deviation     2.0788 1.1378 1.1092 1.07533 0.9518 0.81923 0.81530
Proportion of Variance 0.3601 0.1079 0.1025 0.09636 0.0755 0.05593 0.05539
Cumulative Proportion  0.3601 0.4680 0.5705 0.66688 0.7424 0.79830 0.85369
                           PC8     PC9    PC10    PC11    PC12
Standard deviation     0.74530 0.67824 0.62349 0.43974 0.39760
Proportion of Variance 0.04629 0.03833 0.03239 0.01611 0.01317
Cumulative Proportion  0.89998 0.93832 0.97071 0.98683 1.00000
```
First main result figure is my "PCA plot"

```
#pca$x
ggplot(pca$x) +
  aes(PC1, PC2, label=rownames(pca$x)) +
  geom_point(col=mycols) +
  geom_text_repel(max.overlaps = 6, col=mycols) +
  theme_bw()
```
```
Warning: ggrepel: 67 unlabeled data points (too many overlaps). Consider
increasing max.overlaps
```
The second main PCA result is in the `pca$rotation` we can plot this to generate a so-called "loadings" plot.

```
#pca$rotation
ggplot(pca$rotation) +
  aes(PC1, rownames(pca$rotation)) +
  geom_col()
```

```
ggplot(pca$rotation) +
  aes(PC1, reorder(rownames(pca$rotation), PC1), fill=PC1) +
  geom_col()
```

18

Q24. What original variables are picked up strongly by PC1 in the positive direction? Do these make sense to you?

Fruity, pluribus, and bar are originally picked up strongly by PC1 in the positive direction. These make sense to me.
